

# Campus Placement Prediction

*A full pipeline — synthetic student data generation, domain-knowledge risk scoring, SQLite storage, and verification — built from scratch with Python, Pandas & NumPy.*

## Project Overview

This project generates a synthetic dataset of 10,000 students with academic, behavioral, and extracurricular features to simulate **campus placement outcomes**. A rule-based risk score is used to label students as **“Placed”** or **“Not-Placed”** based on key performance factors like GPA, attendance, backlogs, and coding skills. The dataset is stored in SQLite and exported as CSV for further analysis. It forms a complete data pipeline for building a campus placement prediction model.

## 1. Import Libraries and Setup

**sqlite3** — Built-in Python library for creating and managing SQLite databases

**pandas** — Creates structured DataFrames and handles data export

**numpy** — Generates realistic random data using statistical distributions

```
import sqlite3 as sql import pandas as pd import numpy as np
```

```
In [102... np.random.seed(42)
```

```
In [103... Students = 10000
```

## 2. Configure & Generate Data

Set the random seed for reproducibility and define the dataset size

### Factors affecting the placement of a student :-

- Semester GPA
- Secondary\_Education\_Percentage
- Internal Assessment
- Attendance
- Backlogs
- Club participation
- Work\_Experience\_years
- Disciplinary Actions
- Competitive\_Coding\_Experience ☒

## 3. Build the DataSet Dictionary

Assemble all generated fields into a structured Pandas DataFrame

In [104...

```
data = {
    "Student_id": [f"STU{i:04d}" for i in range(1, Students + 1)],
    "Gender": np.random.choice(["Male", "Female"], Students),
    "Age": np.random.randint(17, 24, Students),
    "Department": np.random.choice(["ME", "CSE", "CIVIL", "AIML"], Students),
    "Internal_Assessment": np.random.randint(0, 101, Students),
    "Secondary_Education_Percentage": np.clip(np.random.normal(95, 35, Students), 0, 100).round(2),
    "Semester_GPA": np.clip(np.random.normal(9.0, 1.5, Students), 0, 10).round(2),
    "Attendance_Percentage" : np.clip(np.random.normal(75, 15, Students), 20, 100),
    "Club_Participation" : np.random.choice([0, 1, 2, 3], Students, p=[0.5, 0.2, 0.2, 0.1]),
    "Disciplinary_Actions" : np.random.randint(0, 5, Students),
    "Backlogs": np.random.randint(0, 5, Students),
    "Work_Experience_Years": np.random.choice([0, 1, 2, 3, 4], Students, p = [0.4, 0.3, 0.1, 0.1, 0.1]),
    "Post_Graduated": np.random.choice(["YES", "NO"], Students, p = [0.7, 0.3]),
    "Competitive_Coding_Experience": np.clip(np.random.choice([0, 1], Students, p=[0.5, 0.5]), 0, 1)
}
```

### Create DataFrame and preview

### 📄 Fetching All Records Using SQL SELECT

`cursor.fetchall()` retrieves **every row** from the table as a list of tuples.

In [118...

```
cursor.execute('''
    SELECT * FROM Students_data
''')
records = cursor.fetchall()
for i in records:
    print(i)

### Close the Database Connection

Always close the connection when done to free up system resources and prevent data corruption.

In [119... `connection.close()`

### Reconstruct DataFrame from SQL Records

In [121... `df = pd.DataFrame(records)`  
df
